

Algorithm — Hotel Room Booking System

1. **Start** the programme.
2. **Display** the Hotel Room Booking System title.
3. **Ask** the user to enter the number of booking records to process.
4. **Repeat** the following steps for each booking, from 1 to the number of bookings:
 1. Input guest name, phone number, room type, room number, number of nights, and payment status.
 2. Validate the number of nights (must be greater than 0) and the room type (must be Single, Double, or Executive).
 3. If the input is invalid, display an error message, record the booking as rejected, and move to the next booking.
 4. If the input is valid, determine the room rate per night based on the room type:
 - Single → GHS 150
 - Double → GHS 250
 - Executive → GHS 400
 5. **Calculate the total cost:** `Total Cost = Room Rate × Number of Nights .`
 6. Determine the booking status:
 - If payment status is "Paid" → "Confirmed Booking"
 - Otherwise → "Pending Payment"
 7. Display the booking summary on screen.
 8. Save the booking summary to the report file.
 9. Update the running count of confirmed, pending, or rejected bookings.
5. After all bookings are processed, display the total number of confirmed and pending bookings.
6. Save the summary totals to the report file.

7. Close the report file.

8. **End** the programme.
